The present invention relates to a novel nucleic acid molecule encoding a ROS repressor protein optimised for plant codon usage and exhibiting ROS operator binding activity and/or ROS repressor activity. The nucleic acid molecule comprises a regulatory region operatively linked to a gene of interest and one or more ROS operator sequence capable of controlling the

New nucleic acid molecule encoding a ROS repressor, useful for controlling gene expression in plants, comprises a regulatory region operatively linked to a gene of interest and one or more ROS operator

                                                                                                                                                        New nucleic acids encoding a ROS repressor optimized for plant codon usage and exhibits ROS operator binding activity, ROS repressor activity or both, useful for regulating gene expression in plants.
```

91; Opp; English.

The present invention relates to a nucleic acid construct comprising a regulatory region operatively linked to a gene of interest and one or more ROS operator sequence capable of controlling the activity of the regulatory region which is functional in plants, encodes a ROS repressor optimised for plant codon usage and exhibits ROS operator binding activity, ROS repressor activity or both. The nucleic acid molecule or its derivative is useful for the regulation of gene expression in plants. The gene expression can be used in metabolic engineering to produce plants that accumulate large amounts of certain intermediate compounds. The present sequence is a polynucleotide used in constructs of the

Sequence 458 BP; 91 A; 105 C; 111 G; 151 T; 0 U; 0 Other,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a novel nucleic acid molecule encoding a ROS repressor protein optimised for plant codon usage and exhibiting ROS operator binding activity and or ROS repressor activity. The nucleic acid molecule comprises a regulatory region operatively linked to a gene of interest and one or more ROS operator sequence capable of controlling the activity of the regulatory region that is functional in plants. They are useful in controlling gene expression in plants using a repressor protein and corresponding operator sequences. The present sequence is Agrobacterium tumefaciens ros repressor codon optimised DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid molecule encoding a ROS repressor, useful for controlling gene expression in plants, comprises a regulatory region operatively linked to a gene of interest and one or more ROS operator

This invention relates to a novel method for regulating gene expression CC in transgenic plants using chromatin remodelling factors. Specifically, CC it comprises transforming a plant with one or more constructs comprising CC a first nucleotide sequence that is operably linked to a regulatory CC region and is capable of binding to a fusion protein, and a second CC nucleotide sequence that encodes said fusion protein. This fusion protein CC comprises a DNA binding protein (VP16 or GAL4), or a portion thereof, CC that can bind to and regulate expression of the gene of interest (i.e. CC the first polynucleotide) and a recruitment factor protein (BNSCL1 or CC invention describes the chromatin remodelling protein as a histone acetyl transferase (HAT) or histone deacetylase (referred to as either HD, HDA CC referably this protein is HDA19. As such, this method can be used to greferably this protein is HDA19. As such, this method can be used to by regulating the expression of a nucleic acid sequence of interest. This cC codon optimised for use in plants, used in an exemplification of the

The methods of the invention may be used for selecting transgenic plants, cells, tissue or entire plants which comprise a coding region of interest. The methods are not based on antibiotic resistance, are simple to carry out and provide a selectable marker system for plant transformation that is benign to the transformed plant and confers no advantage to other organisms in the event of gene transfer. The methods involve stringent selection of transformed cells and use an inexpensive and effective selection agent that is non-toxic to plant cells. The current sequence is that of the Agrobacterium tumefaciens plant-optimised Ros selectable marker DNA of the invention

                                                                                                                                                                                                                                 The present invention relates to a novel nucleic acid molecule encoding a ROS repressor protein optimised for plant codon usage and exhibiting ROS operator binding activity and/or ROS repressor activity. The nucleic acid molecule comprises a regulatory region operatively linked to a gene of interest and one or more ROS operator sequence capable of controlling the activity of the regulatory region that is functional in plants. They are useful in controlling gene expression in plants using a repressor protein and corresponding operator sequences. The present sequence is Agrobacterium tumefaciens ros repressor consensus DNA
                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid molecule encoding a ROS repressor, useful for controlling gene expression in plants, comprises a regulatory region operatively linked to a gene of interest and one or more ROS operator

cu This invention relates to a novel method for regulating gene expression in transgenic plants using chromatin remodelling factors. Specifically, constructs comprises transforming a plant with one or more constructs comprising careful for and is capable of binding to a fusion protein. This fusion protein comprises a DNA binding protein (VP16 or GAL4), or a portion thereof, that can bind to and regulate expression of the gene of interest (i.e. comprises a DNA binding protein (VP16 or GAL4), or a portion thereof, that can bind to and regulate expression of the gene of interest (i.e. conscience) that can bind to a chromatin remodelling protein. The present invention describes the chromatin remodelling protein. The present conscience is the first polymucleotide) and a recruitment factor protein. The present conscience is that the structure of chromatin, considered to a seither HD, HDA conscience is the HDA19. Which is required to alter the structure of chromatin, considered to a seither HD, HDA or HDAC), which is required to alter the structure of chromatin, considered the structure of chromatin, considered the services and phenotype e.g. to increase and a considered the appreciation of a considered to increase and a considered the constant of the present considered the structure of chromatin, considered the services and phenotype e.g. to increase and a considered the constant of a constant of

The nucleic acid molecule or its derivative is useful for the regulation of gene expression in plants. The gene expression can be used in metabolic engineering to produce plants that accumulate large amounts of certain intermediate compounds. The present sequence is a polynucleotide used in constructs of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            usage and exhibits ROS operator binding activity, ROS repressor activity or both, useful for regulating gene expression in plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 447

The nucleic acid molecule comprises a regulatory region operatively linked to a gene of interest and one or more ROS operator sequence capable of controlling the activity of the regulatory region that is functional in plants. They are useful in controlling gene expression in plants using a repressor protein and corresponding operator sequences. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid molecule encoding a ROS repressor, useful for controlling gene expression in plants, comprises a regulatory region operatively linked to a gene of interest and one or more ROS operator

The nucleic acid molecule or its derivative is useful for the regulation of gene expression in plants. The gene expression can be used in metabolic engineering to produce plants that accumulate large amounts of certain intermediate compounds. The present sequence is a polynucleotide used in constructs of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acids encoding a ROS repressor optimized for plant codon usage and exhibits ROS operator binding activity, ROS repressor activity or both, useful for regulating gene expression in plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  21-NOV-2002; 2002WO-CA001807

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  S
                                                                                may be used for selecting transgenic plants, cells, tissue or entire plants which comprise a coding region of interest. The methods are not based on antibiotic resistance, are simple to carry out and provide a selectable marker system for plant transformation that is benign to the transformed plant and confers no advantage to other organisms in the event of gene transfer. The methods involve stringent selection of transformed cells and use an inexpensive and effective selection agent that is non-toxic to plant cells. The current sequence is that of the Agrobacterium tumefaciens wild-type Ros selectable marker DNA of the
                                                                                                                                                                                                                                                                                                                                                                  The invention relates to novel repressor-mediated plant selection strategies to identify and select plants, cells, tissue or entire plants which comprise a coding region of interest. The methods of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Repressor-mediated plant selection strategies to identify transgenic plants comprising using a selectable marker system for plant transformation that is benign to the plant and confers no advantage to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example 2; SEQ ID NO 19; 125pp; English.
